

Qwest IPsec Tunnel Management

Qwest offers full mesh site-to-site or site-to-multi site premises-based (CPE-based) IP VPN management services. This service utilizes existing Qwest Integrated Management (IM) device management functionality with incremental additions to accommodate the requirements of VPN tunnel configuration and management. This service is ideal for customers wanting to use the Internet for their wide area connectivity and have the flexibility of one connection at each location to provide both Internet access and wide area network (WAN) service. Customers with a high volume of Internet traffic that is currently being backhauled to a main location for Internet access can realize significant cost efficiency by offloading this traffic from their WANs. This service is also appealing to customers wanting more security on their frame relay, ATM and Private MPLS networks.

IPsec™ service can add encryption and authentication to these networks to secure the data being transmitted. IPsec is available on Cisco and ADTRAN devices that support IPsec only.

Qwest® Integrated Management is available to business customers throughout the U.S. and internationally. Minimum one year term of commitment required. Early termination fee may apply. Price varies depending on plan selected and number of devices covered. Listed prices do not include taxes, surcharges and other fees.
